Since the human immunodeficiency (HIV) virus emerged 30 years ago, it has become the world’s leading infectious killer.

There are ~35 million people around the world living with HIV.

Although cases of HIV are rising, sub-Saharan Africa remains the most severely affected region, with nearly 1 in every 25 adults living with HIV and accounting for nearly 71% of the people living with HIV worldwide.

Despite this progress, 3 out of 5 people living with HIV are still unable to access ART.

Inequalities in access to treatment and care remain stark across low income and developing countries.

There is still no cure for HIV, but life-changing antiretroviral therapy (ART) has helped gain approximately 40.2 million life years since the start of the epidemic.
